1.1 Project Statement

Six out of nine ethnic groups in Eritrea use Latin language. Saho language is one from the Latin languages spoken in our country. Saho Dictionary is the first software developed for saho language. It is available for android and windows devices. The saho language is translated to English, Arabic, and Italian. In addition the windows version also includes audio pronunciations for the words.

1.2 Objectives

The main objective of the software is to help people learn the saho language. Every individual in or outside of Eritrea can use the software and develop information about the language. Furthermore, it will also be useful in the saho curriculum practiced in some areas of our country.

1.3 Budget

This project took more than a year to research information about the language. It required a lot of research about the saho language. There was no too much sources or information published about the language. In addition since the dictionary was developed for android and windows platforms, this made it very challenging and too much brain work was done to make the applications more reliable and interactive. The breakdown of the main costs is as follows:-

Capital	Cost(Nakfa)
Three Language specialists of English, Arabic, and Italian for checking the accuracy of the translated words.	3 X 15000 = 45000
Owner of the Saho to English translations research paper.	20000
Android Application Developer	30000
Windows Application Developer	30000
Pure saho born person for recording the audio pronunciations.	10000

Total: - 135,000.00 Nakfa

1.4 Conclusion

The saho dictionary is a very useful software for anyone interested in saho language. In the future there is a plan to translate the language to other languages. Since the application does not require any network, it will have a great contribution in our country.
